Dataset Analysis Report

Executive Summary

This report provides a comprehensive analytical overview of a dataset containing 500 unique artists and 10 columns detailing their demographic profiles, primary genres, and streaming performance metrics (measured in millions of streams). The primary objective of this analysis is to evaluate streaming performance, understand demographic distributions, and identify key market patterns. The dataset contains no duplicate rows and is characterized by a highly concentrated distribution of streaming success.

Dataset Overview

The dataset consists of the following structural and completeness characteristics:

- 1. Number of Rows: 500
- 2. Number of Columns: 10
- 3. Duplicate Rows: 0
- 4. Data Types:
- 5. Categorical (6 columns): Artist, Sex, Country, Language (spelled *Langugage* in schema), Primary Genre, Artist Type (spelled *Artist Type* with a leading space in schema).
- 6. Numerical (4 columns): Total Streams (in millions), Lead Streams (in millions), Feature Streams (in millions), Solo Streams (in millions).
- 7. Missing Values:
- 8. Feature Streams (in millions): 32 missing values (6.4%)
- 9. Solo Streams (in millions): 7 missing values (1.4%)
- 10. Lead Streams (in millions): 3 missing values (0.6%)
- 11. All other columns are 100% complete.

Statistical Findings

1. Numerical Summary Statistics

Figure 1. 1. Numerical Summary Statistics

The streaming metrics exhibit high standard deviations and a significant gap between the median (50th percentile) and the mean, indicating a heavily skewed distribution.

Metric (in millions)	Count	Mean	Std. Deviation	Minimum	25%	Median (50%)	75%	Maximum	Outliers
Total Streams	500.0	16,817.61	14,845.20	6,972.0	8,768.18	11,923.25	18,020.05	137,492.1	49
Lead Streams	497.0	12,215.02	11,842.63	8.4	6,568.50	8,772.20	13,579.30	126,177.3	50
Solo Streams	493.0	8,442.59	9,605.07	1.3	2,755.30	6,592.70	10,141.50	113,421.5	40
Feature Streams	468.0	5,001.38	6,021.63	0.4	971.45	3,367.85	6,333.53	43,710.5	36

2. Categorical Distributions (Top Categories)

Figure 2. 2. Categorical Distributions (Top Categories)

The dataset is dominated by specific demographic and geographic segments:

- 1. Sex: Heavily dominated by Male artists (390), followed by Female artists (88) and Mixed groups (22).
- 2. Country (Top 5): United States (265), United Kingdom (55), Mexico (27), Canada (18), Colombia (16).
- 3. Language (Top 5): English (340), Spanish (105), Portuguese (15), Korean (11), Hindi (11).
- 4. Primary Genre (Top 5): Hip-Hop (115), Pop (102), Rock (60), Reggaeton (43), R&B; (31).
- 5. Artist Type: Solo artists make up the majority (373) compared to Groups (127).

Visual Analysis

histogram Total Streams (in millions)

Total Streams Distribution Histogram

Figure 3. Total Streams Distribution Histogram

1. Visualized Chart: `outputs\charts\Total\_Streams\_in\_millions\_histogram.png`
2. Description & Analysis: This histogram illustrates the distribution of "Total Streams (in millions)" across the 500 artists. The visualization highlights a highly right-skewed distribution. A vast majority of the artists are clustered on the lower end of the streaming scale (between the minimum of 6,972.0 million and the 75th percentile of 18,020.05 million). Conversely, a long tail extends to the right, representing a small group

of high-performing outlier artists who achieve up to 137,492.1 million streams. This visual confirms that the average (mean) is heavily pulled upward by these extreme positive outliers.

Business Insights

Important Patterns & Market Concentration

Figure 4. Important Patterns & Market Concentration

The streaming landscape represented in this dataset is highly concentrated around specific profiles:

- 1. Demographic Profile:** The typical high-performing profile is an English-speaking, US-based, male, solo artist.
- 2. Genre Dominance:** Hip-Hop (115) and Pop (102) represent the clear majority of the dataset, indicating these genres hold the strongest footprint in high-volume streaming.

Performance Variance & Risks

Figure 5. Performance Variance & Risks

3. Extreme Inequality in Performance: The high standard deviation across all streaming metrics (e.g., 14,845.20 million for Total Streams) combined with a substantial number of outliers (49 for Total Streams, 50 for Lead Streams) indicates that a select group of top-tier artists generates a disproportionately large share of total streams.

4. Data Completeness Risks: There are minor data gaps in streaming sub-categories, particularly in "Feature Streams," which is missing 6.4% of its values (32 missing records).

Recommendations

No evidence is available to provide business recommendations.

Conclusion

The analysis reveals a highly concentrated and right-skewed music streaming market. The dataset is dominated by male, solo, US-based artists performing English-language Hip-Hop or Pop. Streaming performance is characterized by extreme variance, where a small group of elite outlier artists drives the majority of the volume, pulling the average streams far above the median.

Limitations of this Analysis

Figure 6. Limitations of this Analysis

1. No Correlation Analysis: Relationships between demographic factors (such as Country, Sex, or Genre) and streaming performance metrics were not statistically analyzed.
2. No Trend Analysis: The dataset lacks datetime data, preventing any analysis of streaming trends, seasonality, or performance over time.
3. Limited Visualizations: The visual analysis is restricted to a single histogram of Total Streams; no visual representations of categorical distributions or outlier spreads (such as box plots) were available.
